

Straw Bale Garden

With limited space in the urban environment and having between 3 and 5 hours of direct sunlight I am experimenting with a straw bale garden, which so far, is growing very well after a little more than 3 weeks with a diversity of plants: Swiss chard, cauliflower, scallions, onions, eggplant, broccoli, peas, beans, peppers, lettuce, endive, tomatoes, potatoes, cabbage, Patti pan squash. I follow the guidelines of the book by Joel Karsten.

A soaking hose is a convenient way to water.
